

TechNet International Announces Turnkey IP-Based Surveillance Technologies and Remote Monitoring Systems

July 5, 2005 – Manassas, Virginia

TechNet International announced today its entry into the sales, installation and service of TCP/IP-based remote monitoring and surveillance systems to commercial, industrial and governmental markets throughout the United States.

“This represents a natural progression in TechNet’s ability to provide our customers and the markets we serve with a complete turn-key solution of an IP-based digital surveillance platform to monitor any location or asset anytime, anywhere in the world, right from the convenience of a PC or laptop” said TechNet founder and CEO, Jerry Fischette. “Recent advances in the remote monitoring, surveillance, and video compression technologies have made it very feasible for us to deliver this kind of flexible, reliable, and cost-effective solution that goes hand-in-hand with the traditional network services we provide.”

By leveraging its nationwide coverage of network installation and maintenance services, as well as existing relationships with several major brand name manufacturers and distributors of remote monitoring and surveillance equipment, TechNet is now able to develop, deliver and service complete end-to-end solutions. Customers include national brand retailers, banks, fast food chains, hotels, gas and convenient stores or any company with multiple, dispersed locations.

The remote monitoring and surveillance markets have been gaining momentum recently with the combined introduction of more powerful cameras with built-in digital optics, standard network connection, web server and MPEG4 compression, in addition to more versatile software applications for use over the Internet. Now, by using any standard web browser, security personnel can accurately monitor in real time the inside of a bank vault, front-end teller operations, the back office, POS terminals of retail outlets or the pumps and entrance location of convenient stores located anywhere. “When you stop and think about it, the capabilities this technology creates is limitless!” says Fischette.

About TechNet

TechNet International, Inc. provides installation, service, 24/7 help desk, training, consulting and other related services for satellite, wireless and land-based data and communications systems across North America and abroad.
